

ABSTRACT OF THE DISCLOSURE

An electric double layer capacitor having contained
in a casing an electrolyte, a positive electrode and a
negative electrode each being an electrode containing
5 carbon black, to form an electric double layer at the
interface with the electrolyte, and a separator
interposed between the positive electrode and the
negative electrode, wherein at least one electrode of the
positive electrode and the negative electrode has
10 protruded portions or bent portions formed continuously
in the height direction against the bottom face of the
casing, and a space due to the height of the protruded
portions or the bent portions is formed between said at
least one electrode and the separator.
